### Formula sheet

### Hypothesis testing

Statistic	Population	Sample
Mean	$\mu$	$\bar{X}$
Proportion	$\pi$	p
Correlation	ho	r

- one sample test:  $H_0: \mu = \mu_0$  and  $H_a: \mu > (or <)\mu_0, H_a: \mu \neq \mu_0$
- two sample:  $H_0: \mu_1 = \mu_2$  and  $H_a: \mu_1 > (or <)\mu_2, H_a: \mu_1 \neq \mu_2$
- $\alpha$ : Probability of Type I Error
- $\beta$ : Probability of Type II Error
- One sample test statistic:  $t = \frac{\bar{X} \mu_0}{s/\sqrt{n}}$

#### Statistical distributions

- Uniform, e.g.  $P(X = x) = f(x) = 1/10, x \in \{0, ..., 9\}$
- Normal:  $N(\mu, \sigma)$ ,  $f(x \mid \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$ ,  $-\infty < x < \infty$
- Exponential:  $Exp(\lambda)$ ,  $f(x \mid \lambda) = e^{-\lambda x}$   $x \ge 0$
- Poisson:  $P(X = x \mid \lambda) = \frac{\lambda^x e^{-\lambda}}{x!} \quad x \in \{0, 1, 2, \ldots\}$
- Binomial:  $P(X = x \mid n, p) = \binom{n}{p} p^x (1-p)^{n-x} \ x \in \{0, 1, 2, ..., n\}$
- Pareto:  $f(x \mid \alpha, \lambda) = \frac{\alpha \lambda^{\alpha}}{(\lambda + x)^{\alpha + 1}}$   $x > 0, \alpha > 0, \lambda > 0$
- Weibull:  $f(x \mid \lambda, k) = \frac{k}{\lambda} \left(\frac{x}{\lambda}\right)^{k-1} e^{(-x/\lambda)^k}, \quad x \ge 0$
- Gamma:  $f(x \mid \alpha, \beta) = \frac{\beta^{\alpha}}{\Gamma(\alpha)} x^{\alpha-1} e^{-x\beta}, \quad x \ge 0 \quad \alpha, \beta > 0$

## Likelihood function:

$$L(X_1, ..., X_n | \theta) = P(X_1 = x_1, X_2 = x_2, ..., X_n = x_n | \theta)$$
, for discrete random variables  $L(X_1, ..., X_n | \theta) = f(x_1 | \theta) f(x_2 | \theta) \cdots f(x_n | \theta) = \prod_{i=1}^n f(x_i; \theta)$  for continuous random variables

#### Regression models

## Simple linear:

$$Y = \beta_0 + \beta_1 X + \varepsilon$$

- $\varepsilon \sim N(\mu, \sigma)$
- Fitted values:  $\hat{Y} = b_0 + b_1 X$
- Residual:  $e = Y \hat{Y}$
- Estimates:  $b_1 = r \frac{s_y}{s_x}, b_0 = \bar{Y} b_1 \bar{X}$
- $R^2 = 1 \frac{\sum e^2}{\sum Y^2}$

### Diagnostics:

• Leverage: cutoff 2p/n

• Influence, CooksD: cutoff 4/n

• Collinearity, VIF: cutoff 10

### Model fit and significance:

• 
$$MSE = \frac{\sum_{i=1}^{n} (y_i - \hat{y}_i)^2}{(n-p)}$$

• Confidence interval for  $\beta_k$ :  $b_k \pm t_{\alpha/2,n-2} SE(b_k)$ 

• Confidence interval for predicted value:  $\hat{y} \pm t_{\alpha/2,n-2} \sqrt{MSE(\frac{1}{n} + \frac{n(x-\bar{X})^2}{n\sum_{i=1}^n (X_i - \bar{X})^2})}$ 

• Prediction interval:  $\hat{y} \pm t_{\alpha/2,n-2} \sqrt{MSE(1 + \frac{1}{n} + \frac{n(x-\bar{X})^2}{n\sum_{i=1}^n (X_i - \bar{X})^2})}$ 

#### Generalised linear model:

• Poisson:  $y = exp(\beta_0 + \beta_1 x_1 + \beta_2 x_2) + \varepsilon$ 

• Binomial:  $y = \frac{exp(\beta_0 + \beta_1 x_1 + \beta_2 x_2)}{1 + exp(\beta_0 + \beta_1 x_1 + \beta_2 x_2)} + \varepsilon$ 

#### Decision trees:

ANOVA criterion:  $SS_T - (SS_L + SS_R)$ ,  $SS_T = \sum (y_i - \bar{y})^2$ , and  $SS_L$ ,  $SS_R$  are the equivalent values for the two subsets created by partitioning.

$$RMSE = \sqrt{MSE}$$

# Bayesian thinking

$$P(A \text{ and } B) = P(A)P(B|A)$$

Bayes Theorem:  $P(A|B) = \frac{P(A)P(B|A)}{P(B)}$
